

Case Study:

Movie Studio requires storage growth in existing footprint

Problem: Tapes are stored in aging off-gassing shelving racks, which do not accommodate multiple media types and require aisles between each row of shelving.

Objective: Design a system taking less floor space while adding growth and allowing storage of multiple media types in the same shelving with options to adjust shelving in the future.

Solution: MTM Business Systems designed a state of the art high density mobile shelving system for tape racks.

Our custom solution reduced the movie vault storage footprint required and allowed growth in the existing footprint with multiple mobile storage systems implemented for more storage capacity.

With several types of media being stored in the tape vault, our design encompassed storage for all requirements as well as future media requirements with growth in mind.
